Where:

- (P_1, V_1, T_1) are the initial pressure, volume, and temperature.
- (P_2, V_2, T_2) are the final pressure, volume, and temperature.

Key Concepts to Remember

Before diving into problems, ensure you understand:

- Temperature must be in Kelvin for calculations.
- Pressure and volume are directly related to temperature.
- When solving problems, identify known and unknown variables.
- Use appropriate algebraic steps for solving for the unknowns.

Common Types of Combined Gas Law Problems and Their Answer Keys

Problem 1: Calculating Final Pressure

Question:

A gas occupies 10.0 L at a pressure of 1.00 atm and a temperature of 300 K. If the gas is compressed to 5.00 L and heated to 400 K, what is the final pressure of the gas?

Answer Key:

Step 1: Write known variables:

- $(P_1 = 1.00 \text{ atm})$
- $(V_1 = 10.0 \text{ L})$
- $(T_1 = 300 \text{ K})$
- $(V_2 = 5.00 \text{ L})$
- $(T_2 = 400 \text{ K})$
- Find (P_2) .

Step 2: Apply the combined gas law:

$$\frac{P_1 V_1}{T_1} = \frac{P_2 V_2}{T_2}$$

$$\frac{P_1 V_1}{T_1} = \frac{P_2 V_2}{T_2}$$

$$\frac{P_1 V_1}{T_1} = \frac{P_2 V_2}{T_2}$$

Step 3: Rearrange to solve for (P_2) :

$$P_2 = P_1 \times \frac{V_1}{V_2} \times \frac{T_2}{T_1}$$

$$P_2 = P_1 \times \frac{V_1}{V_2} \times \frac{T_2}{T_1}$$

$$P_2 = 1.00 \times \frac{10.0}{5.00} \times \frac{400}{300}$$

Step 4: Substitute the known values:

$$P_2 = 1.00 \times \frac{10.0}{5.00} \times \frac{400}{300}$$

$$P_2 = 1.00 \times \frac{10.0}{5.00} \times \frac{400}{300}$$

\]

\[

$$P_2 = 1.00 \times 2.00 \times 1.33$$

\]

\[

$$P_2 \approx 2.66 \text{ atm}$$

\]

Final Answer:

The final pressure of the gas is approximately 2.66 atm.

Problem 2: Determining Final Volume

Question:

A sample of gas at 2.00 atm and 25°C occupies 8.00 L. If the pressure increases to 3.00 atm and the temperature rises to 50°C, what is the new volume of the gas?

Answer Key:

Step 1: Convert temperatures to Kelvin:

\[

$$T_1 = 25 + 273 = 298 \text{ K}$$

\]

\[

$$T_2 = 50 + 273 = 323 \text{ K}$$

\]

Step 2: Known variables:

- $(P_1 = 2.00\text{ atm})$
- $(V_1 = 8.00\text{ L})$
- $(T_1 = 298\text{ K})$
- $(P_2 = 3.00\text{ atm})$
- $(T_2 = 323\text{ K})$
- Find (V_2) .

Step 3: Use the combined gas law:

$[$

$$V_2 = V_1 \times \frac{P_1}{P_2} \times \frac{T_2}{T_1}$$

$]$

Step 4: Substitute:

$[$

$$V_2 = 8.00 \times \frac{2.00}{3.00} \times \frac{323}{298}$$

$]$

$[$

$$V_2 = 8.00 \times 0.6667 \times 1.084$$

$]$

$[$

$$V_2 \approx 8.00 \times 0.722$$

$]$

$[$

$$V_2 \approx 5.78\text{ L}$$

\]

Final Answer:

The new volume of the gas is approximately 5.78 L.

Problem 3: Solving for Initial Conditions

Question:

A gas at 1.50 atm and 20°C occupies 12.0 L. When the gas is heated to 100°C at constant pressure, what is its new volume?

Answer Key:

Step 1: Convert temperatures to Kelvin:

\[

$$T_1 = 20 + 273 = 293\text{ K}$$

\]

\[

$$T_2 = 100 + 273 = 373\text{ K}$$

\]

Step 2: Known variables:

- $(P_1 = P_2)$ (constant pressure, so cancels out in calculations)
- $(V_1 = 12.0\text{ L})$
- $(T_1 = 293\text{ K})$
- $(T_2 = 373\text{ K})$
- Find (V_2) .

Step 3: Since pressure is constant, use Charles's law form:

\[

$$\frac{V_1}{T_1} = \frac{V_2}{T_2}$$

\\

Step 4: Solve for (V_2) :

\\

$$V_2 = V_1 \times \frac{T_2}{T_1} = 12.0 \times \frac{373}{293}$$

\\

\\

$$V_2 \approx 12.0 \times 1.272$$

\\

\\

$$V_2 \approx 15.26 \text{ L}$$

\\

Final Answer:

The gas's volume after heating is approximately 15.26 L.

Chemistry Combined Gas Law Problems Answer Key

Understanding the behavior of gases under varying conditions is fundamental in chemistry, especially when dealing with real-world applications ranging from industrial processes to environmental science. One of the essential tools in this domain is the combined gas law, which allows chemists and students alike to solve problems involving relationships between pressure, volume, and temperature of gases. The chemistry combined gas law problems answer key serves as an invaluable resource for mastering these concepts, providing clarity and confidence in tackling complex questions. This article delves into the core principles of the combined gas law, explores common problem-solving strategies, and offers a detailed answer key to typical exercises encountered in chemistry coursework.

The Foundations of the Combined Gas Law

What Is the Combined Gas Law?

The combined gas law synthesizes Boyle's law, Charles's law, and Gay-Lussac's law into a single equation, capturing the interdependence of pressure (P), volume (V), and temperature (T) for a fixed amount of gas. The law is expressed as:

$$\frac{P_1 V_1}{T_1} = \frac{P_2 V_2}{T_2}$$

Where:

- (P_1, V_1, T_1) are the initial pressure, volume, and temperature
- (P_2, V_2, T_2) are the corresponding final states

It assumes that the number of moles remains constant and temperatures are in Kelvin, ensuring proportional relationships hold true.

Why Use the Combined Gas Law?

The combined gas law is particularly useful when multiple variables change simultaneously. Instead of applying multiple separate laws, the combined law offers a streamlined approach, making it ideal for solving complex problems efficiently.

Key Concepts and Variables

- Pressure (P): Often measured in atmospheres (atm), pascals (Pa), or kilopascals (kPa). It reflects the force exerted by gas particles on container walls.
- Volume (V): Typically in liters (L) or cubic meters (m^3), indicating the space occupied by the gas.
- Temperature (T): Always in Kelvin (K), since gas laws rely on absolute temperature scales.
- Number of Moles (n): While not directly included in the combined law, it's assumed constant in these problems unless specified otherwise.

Step-by-Step Approach to Solving Combined Gas Law Problems

- Identify Known and Unknown Variables: Determine which quantities are given and which need to be calculated.
- Convert Temperatures to Kelvin: Add 273.15 to Celsius temperatures if needed.
- Write the Combined Gas Law Equation: Plug in known values, leaving the unknown as a variable.
- Solve for the Unknown: Rearrange the equation algebraically to isolate the variable.
- Check Units and Reasonableness: Ensure all units are consistent and that your answer makes sense within the problem context.

Common Types of Problems and Their Solution Strategies

Below are typical problem scenarios with step-by-step outlines and an answer key to facilitate understanding.

Problem Type 1: Changing Pressure and Volume at Constant Temperature

Given: Gas initially at $(P_1 = 1\text{ atm})$, $(V_1 = 10\text{ L})$, at $(T = 300\text{ K})$. The pressure increases to 2 atm, and volume changes to 5 L. Find the final temperature (T_2) .

Solution Approach:

- Since temperature is constant, use Boyle's law: $(P_1 V_1 = P_2 V_2)$.
- But because temperature varies, use the combined law.

Answer:

[

$$T_2 = \frac{P_2 V_2 T_1}{P_1 V_1} = \frac{2\text{ atm} \times 5\text{ L} \times 300\text{ K}}{1\text{ atm} \times 10\text{ L}} = \frac{3000}{10} = 300\text{ K}$$

]

Observation: The temperature remains unchanged, consistent with Boyle's law.

Problem Type 2: Temperature Change with Pressure and Volume

Given: A gas at $(P_1 = 1\text{ atm})$, $(V_1 = 20\text{ L})$, and $(T_1 = 273\text{ K})$. The pressure is increased to 3 atm, and the volume decreases to 10 L. Find the final temperature (T_2) .

Solution:

[

$$T_2 = \frac{P_2 V_2 T_1}{P_1 V_1} = \frac{3\text{ atm} \times 10\text{ L} \times 273\text{ K}}{1\text{ atm} \times 20\text{ L}} = \frac{8190}{20} = 409.5\text{ K}$$

]

The Answer Key: Solving Typical Gas Law Problems

Here, we present a set of common problems with their detailed solutions to serve as an answer key reference.

Problem 1:

A sample of gas occupies 15 liters at 25°C and 1 atm. If the gas is compressed to 10 liters and heated to 50°C, what is the final pressure?

Solution:

- Convert temperatures to Kelvin:

$$(T_1 = 25 + 273.15 = 298.15, \text{K})$$

$$(T_2 = 50 + 273.15 = 323.15, \text{K})$$

- Use combined gas law:

[

$$P_2 = \frac{P_1 V_1 T_2}{V_2 T_1} = \frac{1, \text{atm} \times 15, \text{L} \times 323.15, \text{K}}{10, \text{L} \times 298.15, \text{K}} \approx \frac{4847.25}{2981.5} \approx 1.63, \text{atm}$$

]

Answer: The final pressure is approximately 1.63 atm.

Problem 2:

A gas at 2 atm and 8 L is heated from 20°C to 100°C at constant pressure. What is the new volume?

Solution:

- Convert temperatures:

$$(T_1 = 20 + 273.15 = 293.15, \text{K})$$

$$(T_2 = 100 + 273.15 = 373.15, \text{K})$$

- Since pressure is constant, use Charles's law:

\[

$$V_2 = V_1 \times \frac{T_2}{T_1} = 8 \text{ L} \times \frac{373.15}{293.15} \approx 8 \times 1.273 = 10.18 \text{ L}$$

\]

Answer: The new volume is approximately 10.18 liters.

Tips for Mastering Gas Law Problems

- Always use Kelvin: Temperature conversions are critical; Celsius temperatures cannot be used directly.
- Maintain unit consistency: Ensure pressure, volume, and temperature units match the given data.
- Identify the variables: Clarify which quantities are changing and which are constant.
- Check the problem context: Does the problem specify constant moles? If not, clarify assumptions.
- Practice with varied problems: Exposure to different scenarios reinforces understanding.

Common Mistakes and How to Avoid Them

- Using Celsius temperatures directly: Always convert to Kelvin.
- Mixing units: Keep units consistent; convert pressure to atm if the initial data is in atm.
- Ignoring the fixed amount of gas: Remember that the number of moles remains constant unless specified.
- Misapplying laws: Recognize whether the problem involves constant temperature (Charles's law), constant pressure (Boyle's law), or both (combined law).

Conclusion: Embracing the Power of the Answer Key

The chemistry combined gas law problems answer key is more than just a resource for verifying solutions; it's a learning tool that enhances conceptual understanding and problem-solving skills. By systematically practicing with these solutions, students can develop a solid grasp of how pressure, volume, and temperature interact in gaseous systems. Whether preparing for exams or applying these principles in practical contexts, mastery of the combined gas law is a cornerstone of proficiency in chemistry. Remember, the key to success lies in understanding the underlying principles, practicing diverse problems, and critically analyzing each step of your solution process.

Question What is the combined gas law, and how is it used in solving problems? The combined gas law relates pressure, volume, and temperature of a fixed amount of gas, expressed as $(P_1V_1)/T_1 = (P_2V_2)/T_2$. It is used to solve problems where these variables change, allowing calculation of unknown values by plugging in known initial and final conditions. How do you approach solving a combined gas law problem step-by-step? First, identify the known and unknown variables, then write the combined gas law formula. Substitute the known values into the equation, ensuring units are consistent. Rearrange to solve for the unknown variable and perform the calculation carefully. What are common mistakes to avoid when solving combined gas law problems? Common mistakes include using inconsistent units (e.g., mixing atm and kPa), forgetting to convert temperatures to Kelvin, mixing initial and final conditions incorrectly, or algebraic errors during rearrangement. Double-check units and conversions before solving. Can the combined gas law be applied when the amount of gas changes? No, the combined gas law assumes a fixed amount of gas. If the amount changes, the ideal gas law ($PV = nRT$) should be used instead, or adjustments should be made to account for the change in moles. Where can I find practice problems and answer keys for combined gas law problems? You can find practice problems and answer keys in chemistry textbooks, educational websites like Khan Academy, ChemCollective, and various online tutoring platforms that provide step-by-step solutions for gas law problems.

chemfiesta answers combined gas law is a popular topic among students studying chemistry, particularly those exploring the fundamental principles that govern the behavior of gases. Understanding the combined gas law is essential for mastering concepts related to gas laws, and chemfiesta provides valuable resources and answers that help clarify these principles. This article offers an in-depth explanation of the combined gas law, including its formula, applications, and how to solve related problems, ensuring students and enthusiasts can grasp the concept effectively.

Understanding the Combined Gas Law

The combined gas law is a fundamental principle in chemistry that relates the pressure, volume, and temperature of a fixed amount of gas. It essentially combines three individual gas laws—Boyle's Law, Charles's Law, and Gay-Lussac's Law—into a single comprehensive equation. This law allows us to predict how changes in one or more of these variables affect the others when the amount of gas remains constant.

Historical Context and Importance

Before diving into the specifics, it's important to recognize the historical development of gas laws:

- Boyle's Law: Describes the inverse relationship between pressure and volume at constant temperature.
- Charles's Law: Explains the direct relationship between volume and temperature at constant pressure.
- Gay-Lussac's Law: Details the direct relationship between pressure and temperature at constant volume.

The combined gas law synthesizes these relationships, providing a more versatile tool for solving real-world problems where multiple variables change simultaneously.

The Combined Gas Law Formula

The combined gas law is expressed mathematically as:

$$(P_1 \times V_1) / T_1 = (P_2 \times V_2) / T_2$$

where:

- P_1 and P_2 are the initial and final pressures,
- V_1 and V_2 are the initial and final volumes,
- T_1 and T_2 are the initial and final temperatures (measured in Kelvin).

This equation states that the ratio of the product of pressure and volume to temperature remains constant for a fixed amount of gas during any process involving simultaneous changes in these variables.

Key Points to Remember

- Temperatures must always be in Kelvin when using the combined gas law.
- The amount of gas (moles) remains constant; otherwise, the law does not apply.
- It's useful for solving problems where pressure, volume, and temperature change simultaneously.

Applications of the Combined Gas Law

The combined gas law has broad applications in various fields such as:

- Laboratory experiments: Predicting how gases behave under different conditions.
- Engineering: Designing systems involving pressurized gases.
- Meteorology: Understanding atmospheric pressure and temperature variations.
- Everyday life: Explaining phenomena like the expansion of a balloon in the heat or the compression of gases in a syringe.

Practical Examples

- Calculating the final pressure of a gas in a sealed container when heated.
- Determining the change in volume of a gas when pressure is increased at a constant temperature.
- Predicting how the pressure exerted by a gas in a tire varies with temperature changes.

Step-by-Step Guide to Solving Combined Gas Law Problems

To effectively solve problems involving the combined gas law, follow these systematic steps:

- Identify the known variables: P_1 , V_1 , T_1 , P_2 , V_2 , T_2 .
- Convert all temperatures to Kelvin:
$$\text{Kelvin} = \text{Celsius} + 273.15$$
- Write down the combined gas law formula.
- Plug in the known values into the formula.
- Solve for the unknown variable.
- Check units and reasonableness of the answer.

Example Problem

Problem:

A gas occupies a volume of 10.0 L at a pressure of 1.00 atm and a temperature of 25°C. If the gas is heated to 75°C and the pressure is increased to 2.00 atm, what is the new volume?

Solution:

- Identify knowns:

$$P_1 = 1.00 \text{ atm}$$

$$V_1 = 10.0 \text{ L}$$

$$T_1 = 25^\circ\text{C} = 298.15 \text{ K}$$

$$P_2 = 2.00 \text{ atm}$$

$$T_2 = 75^\circ\text{C} = 348.15 \text{ K}$$

$$V_2 = ?$$

- Apply the formula:

$$(P_1 \times V_1) / T_1 = (P_2 \times V_2) / T_2$$

- Plug in values:

$$(1.00 \text{ atm} \times 10.0 \text{ L}) / 298.15 \text{ K} = (2.00 \text{ atm} \times V_2) / 348.15 \text{ K}$$

- Solve for V_2 :

$$V_2 = (1.00 \text{ atm} \times 10.0 \text{ L} \times 348.15 \text{ K}) / (2.00 \text{ atm} \times 298.15 \text{ K})$$

$$V_2 = (10.0 \times 348.15) / (2.00 \times 298.15)$$

$$V_2 = (3481.5) / (596.3)$$

$$V_2 = 5.84 \text{ L}$$

Answer: The new volume of the gas is approximately 5.84 liters.

Common Mistakes and Tips

To ensure accuracy when working with the combined gas law, be aware of common pitfalls:

- Forgetting Kelvin: Always convert Celsius to Kelvin before calculations.
- Mixing units: Keep consistent units throughout (e.g., atm for pressure, liters for volume).
- Incorrect variable substitution: Double-check which variables are initial and which are final.
- Ignoring the constancy of moles: The law applies only when the amount of gas remains unchanged.

Tips for success:

- Write down knowns clearly before solving.
- Use a calculator carefully, especially when dealing with multiple steps.
- Practice with various problems to become familiar with different scenarios.

Common mistakes include not converting temperatures to Kelvin, mixing units for pressure and volume, and incorrectly rearranging the formula. Always double-check units and conversions. How does temperature conversion affect your answers in ChemFiesta combined gas law problems? Temperature must be converted to Kelvin because the law is based on absolute temperature. Using Celsius or Fahrenheit will lead to incorrect results. Is the combined gas law applicable to real gases in ChemFiesta? The combined gas law is an idealization assuming gases behave ideally. For real gases, deviations may occur at high pressures or low temperatures, and corrections might be necessary. How do I handle partial pressure when using the combined gas law in ChemFiesta? The combined gas law uses total pressure. If dealing with partial pressures, consider Dalton's law separately, but in most problems, use the total pressure values provided. What tips can help me efficiently solve combined gas law questions in ChemFiesta? Tip 1: Convert all temperatures to Kelvin. Tip 2: Use consistent units for pressure and volume. Tip 3: Write down known values clearly, and isolate the unknown variable before solving. Where can I find more practice problems on the combined gas law for ChemFiesta? You can find additional practice problems on the ChemFiesta platform, in chemistry textbooks, or online educational resources that focus on gas laws and their applications.
