- Record initial water levels.
- Start the timer and note the water level at regular intervals (e.g., every 30 minutes).
- Observe how factors like temperature and surface area influence the rate of evaporation.

Expected Outcome

An increase in temperature or surface area typically leads to a higher rate of evaporation, demonstrating the effect of these variables.

2. Measurement of the Acceleration Due to Gravity Using a Pendulum

Objective

To determine the acceleration due to gravity (g) using a simple pendulum.

Materials Required

- String (about 1-2 meters)
- Rigid support stand or hook
- Small dense object (bob) like a metal washer

- Meter scale or ruler

Procedure

- Attach the bob to one end of the string and suspend it from the support stand.
- Measure the length (L) of the pendulum from the point of suspension to the center of the bob.
- Pull the pendulum back to a small angle (less than 15°) and release without pushing.
- Use the stopwatch to measure the time (T) for 20 oscillations.
- Calculate the period (T?) of one oscillation: $T? = T / 20$.
- Use the formula: $g = (4\pi^2 L) / T?^2$ to compute the acceleration due to gravity.

Notes

Ensure the angle of displacement is small for accurate results and repeat the experiment for consistency.
